**Product description:**

Pair of World Athletic Approved Aluminum High Jump Stands height 60 - 250 cm The stands are part of the essential equipment for high jump training, one of the most popular athletics disciplines.

Here, the athlete is asked to jump over a bar positioned at a given height.

This bar is held in suspension by two supports called uprights.

**The uprights** can be made of steel or aluminum and have **adjustments on different heights** , depending on the category for which they are intended (training, competition, Olympic)

**This model is dedicated to high-level competitions, being equipped with World Athletics approval.**

The uprights allow the **adjustment of the barrier from a minimum of 60 to a maximum of 250 cm (the high jump world record is currently 245 cm)**

They are made of **aluminum with a section of 32x32mm**, and have a large **40.5x40.5cm square steel base with wheels which, in addition to ensuring stability, facilitates movement on the track. The wheels are positioned so that they do not touch the track unless the upright is tilted, thus avoiding accidental movements.**

**To adjust the jump size, they have a sliding system for the poles and a double support for the crossbar.** In this way, it is possible to use them for both junior and senior categories.

in combination with one of our **FALLING MATTRESSES** , **they are the ideal configuration to introduce athletes to this wonderful Olympic discipline, which also finds many champions in Italy.**

**This pair of approved uprights is intended for high jump competitions of any level.**
