

Installation kit for beach volleyball and beach tennis systems without holes

**Product features:**

Material: 1.5mm thick tubular steel

Finish: Powder-coated

**Product description:**

**Installation kit for Beach Volleyball and Beach Tennis systems without holes for mobile installation.**

This particular base was designed to meet the common need of the **impossibility of fixing beach volleyball/tennis systems to the ground** with the classic holes. This need manifests itself above all in the case in which the **sports installation is temporary**, such as during a city sports event where perforation of the road surface or civic paving is impracticable.

The base has a large surface area of 300 x 207 cm over 6 m<sup>2</sup> per single pole (achieved thanks to the insertion of two beech wood planks included in the kit). This guarantees **perfect stability to the system** and consequently a **gaming experience** absolutely identical to that resulting from the same model fixed with holes. Furthermore, **the stability of the system gives maximum safety to the playing field** as the posts, with the net tensioned, are substantially unbreakable.

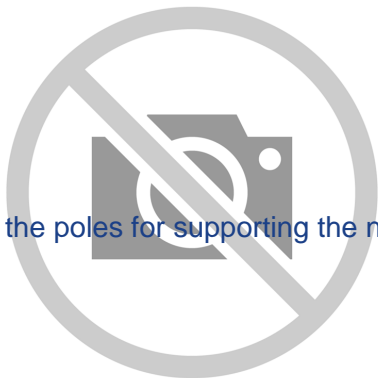

Installation is already permitted with a minimum thickness of 30/40 cm of sand.

The price is for the pair of bases complete **with beech wood planks** and is available in two versions:

for PRO implants with a diameter of 80 mm (GS0365)

for 50mm EKO systems (GS0357)

**Made in Italy product**, entirely made in our factories.

ATTENTION: the poles for supporting the net are sold separately.
